

KELLEN

KERANOVA

A Great Alternative to Clay Materials

We see the raw materials of sand and clay all around us in natural form and with their characteristic earthy colours and textures they form the basis for many ceramic material solutions. This is the essence of the inspiration for the Keranova range.

Varying sized natural stone granulates, which are specially selected by colour, are used for the coating of Keranova. This creates an encapsulated coating of deep ceramic colours. The concrete granulates allow for a freedom of shape and is therefore available in many sizes. Keranova is a great alternative to clay materials in environments within a traditional street scene..

Key Features

- Clay paver appearance & colours
- Traditional block paving sizes
- Top layer of 80% natural stone aggregates
- Two grain sizes of aggregate
- Normal surface (no exposed aggregates)
- Colour support by pigments
