

Aquata Clay

A Permeable Paving Solution

Aquata Clay

A Permeable Paving Solution

Aquata is a uniquely shaped clay block which provides the wearing course over the system's permeable bedding aggregate, through which surface-run off can drain into the natural rainwater systems. The Aquata range of permeable clay pavers demonstrate that function and beautiful landscape design can go hand in hand.

These dutch-style pavers are precision engineered to drastically increase water re-absorption, but without losing the versatile laying options

The successful drainage of excess surface water is a huge problem in urban areas where there is little green space and permeable ground. Aquata pavers offer a solution to this by providing a controlled method of draining away rainwater, whilst also embodying the performance and aesthetics of standard clay pavers.

Specification:

Work Size	200x65x80mm
Dimensional Deviation	R1 (BS EN 1344:2013)
Mean Transverse Breaking Load	T4 (BS EN 1344:2013)
Unpolished Slip/Skid Resistance	U3 (BS EN 1344:2013)
Abrasion Resistance	A2 (BS EN 1344:2013)
Pack Quantity	600
Individual Net Weight	2.23KG
