

Greenbrick

A Green Paving Solution

Greenbrick

A Green Paving Solution

Greenbrick provides a permeable solution that combines natural paving materials with a grass and plastic block system for use along pavements, walkways and to create defined parking bay areas in and around typical urban settings. Most conventional grass concrete pavers are often an uninspiring grey, maintaining their concrete-like appearance throughout the greenery.

Greenbrick is a hollow block made of plastic, shaped to ensure a good connection in the laying pattern and where grass is allowed enough room to grow. Specially applied reinforced 'ribs' ensure strength and stability enabling the setts or slabs around the Greenbrick to conform. The Greenbrick is constructed with an open membrane compared to normal grass concrete pavers allowing the grass itself extra nutrition and growing space for optimum desired results.

OVERVIEW BENEFITS:

- Aesthetic design
- Sustainable water infiltration
- Creative laying patterns
- Promotes 'green' conservation
- Linkable blocks
- Suitable for light vehicular traffic

SPECIFICATIONS

Material	Plastic (HDPE)
Max pro m ²	13 pieces
Colours	Black (green and terracotta are available on request)
